1 | **Finite-Dimensional Vector Spaces**

```
title: Review
F denotes R or C
V denotes a [[file:KBe20math530refVectorSpace.org][KBe20math530refVectorSpace]] over F
```

- lin alg does not focus on arbitrary vector spaces
- it focuses on finite-dimensional vector spaces!

```
title: learning objectives for the chapter
- span
- linear independence
- bases
- dimension
```

- **notation**:
  - lists of vectors:
    - (2,1,4),(3,2,5)
      - list len 2 of vectors in R^3
    - n-tuples without surrounding parens
- *linear combination*
  - a linear combination of *x* and *y* would be any expression of the form *ax* + *by*, where *a* and *b* are constants ~wiki
  - multiply each element in a list of vectors by an element in F
  - and then add them up!
  - any relation between the element scalar and what's being multiplied? can the scalars repeat? #question
- *span*
  - the set of all linear combos of a list of vectors
    - denoted: span(v1,…,vm)
  - span of empty list is {0}
  - aka. linear span

```
the span of a list of vectors in V is the smallest subspace of V containing all the vectors in the list
```

```ad-question
but don't you get out a single vector at the end..? because you add them? #question
```

uhhhhhhhhhh, ok?
