

1 | the equation

The goal is to add a bunch of slices, $d\theta$. For instance, you can approximate each slice as a sector of a circle:

$$dA = \underbrace{(\pi r^2)}_{\text{Area of the full circle}} \underbrace{\frac{d\theta}{2\pi}}_{\text{Fraction of the circle}}$$

$$dA = (\pi r^2) \frac{d\theta}{2\pi}$$

where The area of the full circle
The portion of the circle covered by $d\theta$

And so, the full equation would be

$$A = \int_0^{2\pi} \frac{1}{2} r^2 d\theta$$

Make sure you pick the bounds such that it only goes once around! If it's a cardioid with overlappy bits then you gotta make sure you know what area you're talking about.

1.1 | alternative formulation

You could also formulate the circle slice as an icosolese triangle, where the base is $r d\theta$ and the height is r . Then, the area of the triangle is

$$dA = \frac{1}{2} b h = \frac{1}{2} r^2 d\theta$$

Which results in the same equation as above.
