Link

- #define continuity at a point
-

$$\lim_{x \rightarrow a} f(x) = f(a)$$

- To ensure that it is defined, connected on both sides, and doesn't have a random point
- To check for continuity, just check for $f(a)$, $\lim_{x \rightarrow a} f(x)$, and that they are equal
- Rational functions
 - Are continuous on their domains
 - * Basically anywhere they are defined
- Discontinuity types
 - Removable discontinuities
 - * Hole in the graph
 - infinite is continuity
 - * asymptote
 - jump discontinuity
- Continuity from the right and left
 - Same as definition of continuous, but replace the limit with right and left hand limits respectively

Link - Basically the same thing - Properties of continuous functions (group like bits) - > Let f and g be continuous functions on an interval I , let a be a real number and let n be a positive integer. The following functions are continuous on I .

- > - Sums/Differences : $f \pm g$
- > - Constant Multiples : cf
- > - Products : fg
- > - Quotients : f/g (as long as $g \neq 0$ on I)
- > - Powers : f^n
- > - Roots : $f(x) = \sqrt[n]{x}$ (if n is even then $f \geq 0$ on I ; if n is odd, then true for all values of f on I .)
- > - Compositions : Adjust the definitions of f and g to: Let f be continuous on J , where the range of g on I is J , and let g be continuous on I . Then $f \circ g$, i.e., $f(g(x))$, is continuous on I .
