

## 1 | Setup

```
library(tidyverse)
library(TSA)
```

## 2 | Data Sourcing

We first grab the data.

```
dataset_raw <- read.csv("./09162021_3rd_fl_jar_small_bead.csv")
dataset_tibble <- tibble(dataset_raw
  #+begin_quote
  #+end_quote
)

# rename tibble titles
dataset_tibble <- dataset_tibble %>% rename(time = Time..sec., max_height_x=Max.Height.X, max_height_y=Max.Height.Y)
```

## 3 | Basic plotting

### 3.1 | Time vs. Max Height

Plot time against max height.

```
g <- dataset_tibble %>% ggplot()
g <- g + geom_line(aes(x=time, y=max_height_y))
g
```

We should probably chop off the end bit, because that's just the chain flinging itself off.

```
dataset_sliced <- dataset_tibble %>% slice_head(n=which(dataset_tibble$max_height_y == max(dataset_tibble$max_height_y)))
```

And plotting again...

```
g <- dataset_sliced %>% ggplot()
g <- g + geom_line(aes(x=time, y=max_height_y))
g
```

We will do the same thing

### 3.2 | Time vs. X-Value at Max Height

We will plot and slice the same bit too, but for the x-value.

```
g <- dataset_sliced %>% ggplot()
g <- g + geom_line(aes(x=time, y=max_height_x))
g
```

The wave could be ran through an fft.

```
dataset_sliced$max_height_x %>% periodogram()
```
