

## 1 | Axler3.30 #def matrix $A_{j,k}$ def

A  $mn$  matrix is a rectangle of numbers with  $m$  rows and  $n$  columns. And other stuff you would expect

## 2 | Axler3.32 #def matrix of a linear map, $\mathcal{M}(T)$ def

Suppose  $T \in \mathcal{L}(V, W)$  and  $v_1, \dots, v_n$  is a basis of  $V$  and  $w_1, \dots, w_m$  is a basis of  $W$ . The *matrix of  $T$*  with respect to these bases is the  $m \times n$  matrix  $\mathcal{M}(T, (v_1, \dots, v_n), (w_1, \dots, w_m))$  whose entries  $A_{j,k}$  are defined by

$$Tv_k = A_{1,k}w_1 + \dots + A_{m,k}w_m$$

Note that for each output  $Tv_k$  is a linear combination of a column.

## 3 | Algebra things

### 3.1 | Axler3.35 #def Matrix Sum def

Pointwise addition, pretty straight forward. **Only works on matrices of the same size!**

### 3.2 | Axler 3.36 The matrix sum of linear maps

Basically matrices that are linear maps also satisfy additivity of linear maps (Given  $S, T \in \mathcal{L}(V, W)$ ,  $\mathcal{M}(S) + \mathcal{M}(T) = \mathcal{M}(S + T)$ )

### 3.3 | Axler3.37 and Axler3.38 (same for scalar multiplication)

Its the same for scalar multiplication, yay

## 4 | Notation Axler3.39 $\mathbb{F}^{m,n}$ notation

$\mathbb{F}^{m,n}$  is the set of all  $m \times n$  matrices with entries in  $\mathbb{F}$ .

## 5 | Axler3.40 $\dim \mathbb{F}^{m,n} = mn$

$\mathbb{F}^{m,n}$  is itself a vector space with dimension  $mn$ . (Each basis vector being a matrix with a single one at  $i, j$  for each pair of  $i, j$ )?

## 6 | Axler3.44 $A_{j,\cdot}, A_{\cdot,k}$

The dot just means "everything in that row/column".

## 7 | Axler 3.49 Column of matrix product equal matrix times column

For  $m \times n$  matrix  $A$  and  $n \times p$  matrix  $C$ ,

$$(AC)_{\cdot,k} = AC_{\cdot,k}$$

.

## 8 | And many other ways to think about matrix multiplication
