## 1 | lets find out

- it's cus of the moons formation?
- venus and earth:
  - similar composition and size
  - but venus doesnt have a magnetic field!
- magnetic field needs a moving liquid core
  - people thought that this was the reason for the lack of magnetic field but it's not
- people think it's about no convection
  - stable lables prevent the convection needed to generate the field
- on earth the moon disrupted, mixing the elements throughout the earth
  - this means they can't form the stable homogenous layers
