

1 | The Cell('s) (Life)Cycle

1.1 | So, why do cell divide

Everyday, 50-70 Billion die (**programmed cell death**, apoptosis), so...

The ability to produce organisms more of their kind is one characteristic that best distinguishes living things from nonliving matter

KBhBIO101Viruses and organelles challenge this definition => they are symbiotic and cannot reproduce on their own. But like screw them right?

To compensate for programmed cell death, (cell division) happen.

Before we continue, do yourself a favor and review KBhBIO101DNAStructures

1.2 | So, when do cells divide? (The Actual Cell Cycle)

The cell follows a lifecycle from new cell to cell-too-bit-aaa-gotta-divide called... you ready for this? "Cell Cycle". At the pointy bit of the cell cycle, the cell reproduces KBhBIO101CellReproduction. And et viola the cell cycle!

For more, see KBhBIO101CellCycle.
