

1 | Fluid mosaic model of cell membrane

Some Phospholipids connected as a "phospholipid bi-layer" (see KBhBIO101StructuresOfLipids structure

- Charged head
- Nonpolar tail

So, head aligns and tail aligns, creating the basic structure of the membrane:

Figure 1: Screen Shot 2020-09-09 at 3.08.10 PM.png

This is called the "fluid mosaic" model because there is nothing holding these together.

1.1 | Stuff in the membrane

Cholesterol

Helps cells communicate

Proteins

- Makes sure the right molecules get in/out
- Nonpolar Oxygen + CO₂ could easily get through
- Polar and charged molecules can't get through, unless...
- Channeled proteins let specific polar particles through

Through various K_BH_BIO₁₀₁CellMembranes protean transports, chemicals could get in and out of the cell.
