1 | Central Dogma

- The central dogma says that protein instructions are found in DNA
 - RNA carries these instructions somewhere which manufactures proteins
 - Parts of DNA are transcribed into RNA
- In short DNA – > RNA – > Protein
 - This is done because moving DNA doesn't make sense as it's the master copy
 - RNA is moved to the place that the protein can be made from the instructions
- This is done through transcription and translation
 - Notes on that can be found here [KBBIO101TranscriptionTranslation](#)
- DNA and RNA are very close aside from Uracil and Thymine
 - Both of the codes are formed by patterns of charges
