2.1 | a: skipped

2.2 | find maclaurin series for f'(x) where $f(x) = \sum_{k=0} \frac{(2x)^{k+1}}{k+1}$

$$\frac{d}{dx} \frac{(2x)^{n+1}}{n+1} = \frac{(n+1)^2 (2x)^n (2)}{(n+1)^2} = 2(2x)^n$$

Instead of using the quotient rule, $\frac{1}{k+1}$ is a constant for each term so we can just use the chain and power rules:

$$\frac{d}{dx}\frac{(2x)^{k+1}}{k+1} = \frac{1}{k+1}\frac{d}{dx}(2x)^{k+1} = \frac{1}{k+1}(k+1)(2x)^k(2) = 2(2x)^k$$

So, our series is just

$$\sum_{k=0}^{\infty} 2(2x)^k = 2 + 4x + 8x^2 + 16x^3 + \cdots$$

2.3 | estimate $f'\left(-\frac{1}{3}\right)$

When only using the first 4 terms:

$$2 + 4\frac{-1}{3} + 8\left(\frac{-1}{3}\right)^2 + 16\left(\frac{-1}{3}\right)^2 = \frac{10}{3}$$

For the entire sequence:

$$\sum_{k=0}^{\infty} 2\left(\frac{-2}{3}\right)^k = 2\sum_{k=0}^{\infty} \left(-\frac{2}{3}\right)^k = \frac{2}{1 - -\frac{2}{3}} = \frac{2}{\frac{5}{3}} = \frac{6}{5}$$

because the series is geometric.
