1 | Looking forward

- Will use canvas's discussion board in the future.
- · Assume matrices have real numbers

2 | Solving with Matrices

- Elementary matrices (like $\begin{bmatrix} 1 & -2 \\ 0 & 1 \end{bmatrix}$)
- · Steps walk through
 - Start with $\begin{bmatrix} a & b \\ d & e \end{bmatrix}$ (the coefficient matrix).
 - You want to get somewhere such that $\begin{bmatrix} 1x \\ 0y \end{bmatrix} = \begin{bmatrix} c \\ f \end{bmatrix}$
 - And ultimately $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} ans_x \\ ans_y \end{bmatrix}$

3 | Matrix Inverse Formula

· I should technically know this already.

3.1 | Derivation

$$\label{eq:continuous} $$ \left[a\&b\&d\right]\left[w\&x\&z\right]\left[aw+by\&ax+bz\&cw+dy\&cx+dz\right]\&continuous\\ (...)$$

• There's two 2 variable equations. srcIdentityMatrixFormula.png

4 | Matrix Operations

- If we have a set of objects that are almost groups in under both addition and multiplication, then it's called a field
 - 2x2 Matrices aren't quite close enough on the multiplication (too many no inverses) but we can work with other sizes. ### Vector Products
- Matrices of dimension nx1
- What multiplications on vectors are "nice"?
 - Transpose the first (left) one and multiply normally, then squish 2x2 into 2x1
 - Cross product

Exr0n • 2021-2022 Page 1

- Element wise (is closed)
- Take every element and multiply them all together, and then duplicate?
 - * No, no identity
- Any one to one mapping?
 - * No, identity doesn't work if it's on the left.
