### 1 | Lemma

The length of a linearly indpendent list is less than or equal to the length of a spanning list over some vector space V.

# 2 | Intermediate Result: Span of a linearly independent extension of a linearly independent list has more elements than the span of the original list.

#### 2.1 | Lemma

Given a linearly independent list  $v=v_1,\ldots,v_k$  where each vector  $v_1,\ldots,v_k\in V$  and another vector  $v_{k+1}$  which is linearly independent with v, show that

span 
$$(v_1, ..., v_k, v_{k+1})$$

contains elements that are not in

$$span(v_1,\ldots,v_k)$$

TODO: This needs to show that a longer list will have a larger span, not just an extended one.

#### 2.2 | **Proof**

Because  $v_{k+1}$  is linearly independent with v, it cannot be written as a linear combination of elements in v. Thus,

$$v_{k+1} \notin \operatorname{span}(v_1, \dots, v_k)$$

However,  $v_{k+1}$  must be in the span of the extended list, because we can write  $v_{k+1}$  as

$$0v_1 + 0v_2 + \ldots + 0v_k + 1v_{k+1}$$

Thus, the extended list contains atleast one element that the original did not.

## 3 | **Proof**

Given a spanning list  $u=u_1,\ldots,u_j$  and a linearly independent list  $v=v_1,\ldots,v_k$ , show that the  $|u|\geq |v|$ . The Linear Dependence Lemma states that while u is linearly dependent, it is possible to remove some vector  $u_i$  from u such that the span stays the same. Thus, there exists a linearly independent list b that has the same span as u, aka that also spans V. Because this list can be obtained by removing elements from u,  $|b| \leq |u|$ .

The linearly independent list v must be shorter than or equal to b in length, because otherwise, span v would have more elements than span b by the intermediate result. Thus,  $|v| \le |b| \le |u|$ .
