1 | the parabola

A parabola (defined by a focus point and a directrix line) is the set of points

$$\{P: |FP| = \text{ distance from } P \text{ to } L\}$$

1.1 | polar equation that describes the parabola

$$\begin{split} r &= r(\theta) \\ &= d - r\cos\theta \\ r + r\cos\theta &= d \\ r(1+\cos\theta) &= d \\ r &= \frac{d}{1+\cos\theta} \end{split}$$

1.2 | show that cartesian version matches what we expect

Checked using desmos.

$$r = \frac{d}{1 + \cos \theta}$$

$$x = \left(\frac{d}{1 + \cos \theta}\right) \cos \theta$$

$$= \frac{d \cos \theta}{1 + \cos \theta}$$

$$y = \left(\frac{d}{1 + \cos \theta}\right) \sin \theta$$

$$= \frac{d \sin \theta}{1 + \cos \theta}$$

$$x^2 + y^2 = \frac{d^2}{(1 + \cos \theta)^2}$$

$$x^2 + y^2 = \frac{d^2}{\left(1 + \frac{x}{\sqrt{x^2 + y^2}}\right)^2}$$

$$(x^2 + y^2) \left(1 + \frac{x}{\sqrt{x^2 + y^2}}\right)^2 = d^2$$

$$(x^2 + y^2) \left(\frac{x^2}{x^2 + y^2} + \frac{2x}{\sqrt{x^2 + y^2}} + 1\right) = d^2$$

$$(x^2 + y^2) \left(\frac{x^2}{x^2 + y^2} + \frac{2x\sqrt{x^2 + y^2}}{x^2 + y^2} + 1\right) = d^2$$

$$x^2 + 2x\sqrt{x^2 + y^2} + \frac{1}{x^2 + y^2} = d^2$$

ugh. too hard.

Taproot • 2021-2022 Page 1

Page 2

$$r = d - r \cos \theta$$

$$= d - x$$

$$\sqrt{x^2 + y^2} = d - x$$

$$x^2 + y^2 = d^2 + x^2 - 2dx$$

$$y^2 = d^2 - 2dx$$

$$y^2 - d^2 = -2dx$$

$$\frac{d^2 - y^2}{2d} = x$$

$$x = -\frac{y^2}{2d} + \frac{d}{2}$$

more scratch work below:

$$\begin{split} \frac{d\sin\theta}{1+\cos\theta} &= \frac{d\cos\theta}{1+\cos\theta} \\ (d\sin\theta)(1+\cos\theta) &= (d\cos\theta)(1+\cos\theta) \\ (d\sin\theta) &= (d\cos\theta) \\ \frac{d}{1+\cos\theta} &= \sqrt{\frac{d^2\cos^2\theta + d^2\sin^2\theta}{(1+\cos\theta)^2}} \\ d &= \sqrt{d^2\cos^2\theta + d^2\sin^2\theta} \end{split}$$

1.3 | **vertex**

$$\left(\frac{d}{2},0\right)$$

2 | general form

2.1 | re-derivation

$$\begin{split} e &= \frac{r}{d-r\cos\theta} \\ r &= r(\theta) \\ &= e(d-r\cos\theta) \\ &= de - er\cos\theta \\ r + er\cos\theta &= de \\ r(1+e\cos\theta) &= de \\ r &= \frac{de}{1+e\cos\theta} \end{split}$$

Link to the desmos.

Taproot • 2021-2022

2.2 | elipse when 0 < e < 1

$$r = e(d - r \cos \theta)$$

$$= e(d - x)$$

$$\sqrt{x^2 + y^2} = e(d - x)$$

$$x^2 + y^2 = (e(d - x))^2$$

$$x^2 + y^2 = e^2 (d^2 + x^2 - 2dx)$$

$$x^2 + y^2 = d^2 e^2 + e^2 x^2 - 2de^2 x$$

$$-e^2 x^2 + 2de^2 x + x^2 + y^2 = d^2 e^2$$

$$(1 - e^2) x^2 + 2de^2 x + y^2 = d^2 e^2$$

$$(1 - e^2) \left(x^2 + \frac{2de^2}{1 - e^2}x\right) + y^2 = d^2 e^2$$

$$\left(x^2 + \frac{2de^2}{1 - e^2}x\right) + \frac{y^2}{(1 - e^2)} = \frac{d^2 e^2}{(1 - e^2)}$$

$$\left(x^2 + \frac{2de^2}{1 - e^2}x\right) + \frac{y^2}{(1 - e^2)} = \frac{d^2 e^2}{(1 - e^2)}$$

$$\left(\left(\frac{de^2}{1 - e^2}\right)^2 + x^2 + \frac{2de^2}{1 - e^2}\right) + \frac{y^2}{(1 - e^2)} = \frac{d^2 e^2}{(1 - e^2)} + \left(\frac{de^2}{1 - e^2}\right)^2$$

$$\left(x + \left(\frac{de^2}{1 - e^2}\right)\right)^2 + \frac{y^2}{(1 - e^2)} = \frac{d^2 e^2 - d^2 e^4 + d^2 e^4}{(1 - e^2)^2}$$

$$\left(x + \left(\frac{de^2}{1 - e^2}\right)\right)^2 + \frac{y^2}{(1 - e^2)} = \frac{d^2 e^2}{(1 - e^2)^2}$$

$$\frac{(1 - e^2)^2 \left(x + \left(\frac{de^2}{1 - e^2}\right)\right)^2}{d^2 e^2} + \frac{(1 - e^2)y^2}{d^2 e^2} = 1$$

$$\frac{((1 - e^2)x + de^2)^2}{d^2 e^2} + \frac{(1 - e^2)y^2}{d^2 e^2} = 1$$

$$x_0 = -\frac{de^2}{1 - e^2}$$

$$y_0 = 0$$

$$a = \frac{de}{1 - e^2}$$

$$b = \frac{de}{\sqrt{1 - e^2}}$$

for e < 1.

The desmos.

2.3 | hyperbola

Going back to one of the preivous equations

Taproot • 2021-2022 Page 3

$$\frac{(1-e^2)^2 \left(x + \left(\frac{de^2}{1-e^2}\right)\right)^2}{d^2 e^2} + \frac{(1-e^2)y^2}{d^2 e^2} = 1$$
$$\frac{(1-e^2)^2 \left(x + \left(\frac{de^2}{1-e^2}\right)\right)^2}{d^2 e^2} - \frac{(e^2-1)y^2}{d^2 e^2} = 1$$

That makes

$$x_0 = -\frac{de^2}{1 - e^2}$$
$$y_0 = 0$$
$$a = \frac{de}{1 - e^2}$$
$$b = \frac{de}{\sqrt{e^2 - 1}}$$

b will be complex unless e > 1.

The asymtotes:

$$y = \frac{b}{a}x = -\frac{e^2 - 1}{\sqrt{e^2 - 1}}x = -\sqrt{e^2 - 1}x$$
$$y = -\frac{b}{a}x = \frac{\sqrt{e^2 - 1}}{e^2 - 1}x = \sqrt{e^2 - 1}x$$

2.4 | degenerate ellipse

It is a circle when $a^2 = b^2$, aka

$$\frac{d^2e^2}{(1-e^2)^2} = \frac{d^2e^2}{1-e^2}$$
$$(1-e^2)^2 = 1-e^2$$
$$1-e^2 = 1$$
$$e^2 = 0$$
$$e = 0$$

You have to take the limit. You get

$$x^2y^2 = d^2e^2 = r^2$$

What could d possibly be for $\lim_{e \to 0} de \neq 0$?

$$d = \frac{n}{e}$$

$$\lim_{e \to 0} de = \lim_{e \to 0} \frac{ne}{e}$$
