1 | an example: semicircle revolved around the x-axis to create a sphere

We can make cuts perpendicular to the axis of rotation. In this case, you end up with a bunch of circular disks, where the height of each slice is your semicircle function.

Thus, the volume of the disk is

$$\pi f^2(x_i)\Delta x = (a^2 - x^2)\pi \Delta x$$

This is kinda like a Riemann Sum, but with more stuff added on. We can take the limit of the sum

$$\lim_{n\to\infty}\sum_{k=1}^n\pi(a^2-x_i^2)\Delta x$$

Where $\Delta x = \frac{1}{n}$ and $x_i = -a + \frac{2ak}{n}$

Expressed as an integral:

$$\int_{-a}^{a} \pi(a^{2} - x^{2}) dx \to \int \pi a^{2} dx - \int \pi x^{2} dx$$

$$= \pi a^{2} x - \pi \frac{1}{3} x^{3}$$

$$\to \pi a^{3} - \pi \frac{1}{3} a^{3} + \pi a^{3} + \pi \frac{1}{3} (-a)^{3}$$

$$= 2\pi a^{3} - \pi \frac{2}{3} a^{3}$$

$$= \frac{4}{3} \pi a^{3}$$

2 | now lets try a cone

Rotate

$$y = -ax + b$$

Around the y-axis. Then, each circle (which is layed out flat) has thickness dy and radius x or $\frac{y-b}{-a}$

The volume of the disk is then

$$\pi \left(\frac{y-b}{-a}\right)^2 dy$$

Or using r, h as the radius and height of the cone,

$$\pi \left(r - \frac{r}{h}y\right)^2 dy$$

And we can take the integral of that from 0 to \hbar

$$\begin{split} \int_0^h \pi \left(r - \frac{r}{h}y\right)^2 dy &\to \pi \int \left(r - \frac{r}{h}y\right)^2 dx \\ \text{Let } u = r - \frac{r}{h}y, du = -\frac{r}{h}dx \\ &= \pi - \frac{h}{r} \int u^2 du \\ &= -\pi \frac{h}{r} \frac{1}{3}u^3 + C \\ &= -\pi \frac{h}{r} \frac{1}{3} \left(r - \frac{r}{h}y\right)^3 \\ \int_0^h \pi \left(r - \frac{r}{h}y\right)^2 dy &\to \pi \int r^2 + \left(\frac{r}{h}y\right)^2 - 2r\left(\frac{r}{h}y\right) dx \\ &= \frac{1}{3}\pi r^3 + \frac{1}{3}\frac{r^2}{h^2}y^3 \end{split}$$
