## 1 | Matrices

## 1.1 | **1a**

 $BA = \begin{bmatrix} 58 & 64 \\ 139 & 154 \end{bmatrix}$  BA is not equal to AB because  $AB \in \mathbb{R}^{3 \times 3}$  whereas  $BA \in \mathbb{R}^{2 \times 2}$  so there's no way that AB = BA could be true.

## 1.2 | **1b**

$$det(BA) = (58)(154) - (64)(139)$$
$$= 36$$

## 1.3 | **1c**

$$AB = \begin{bmatrix} 39 & 54 & 69 \\ 49 & 68 & 87 \\ 59 & 82 & 109 \end{bmatrix}$$

$$det(AB) = (30)(68)(109) + (54)(87)(59) + (69)(49)(82) - (69)(68)(59) - (54)(49)(109) - (39)(87)(82)$$

$$= 24$$
