1 | #definition Homogeneous Equation

When the right side equals zero.

2 | Properties

- 2.1 | If a linear combination of linearly independent vectors then all coefficients are $\mathbf{0}$
- 2.2 | if linearly dependent, then are multiple solutions (atleast dim1 infinitely many because you can scale)
- 2.3 | There's always a solution: the trivial one (all coefficients are zero)
- 2.3.1 |unlike systems of equations, you can't have no solution because linear maps take zero to zero
