1 | Earth's Gravitatonal Field

Extends infinitely large, but there is a point whereby it is imperceivable.

First, Newton's Law of Universal Gravitation.

 $\vec{F}_g = -\frac{M_2M_1G}{R^2} \cdot \hat{r}$, where G is the Universal Gravity Constant and r is a direction ("unit vector") tha points from M_1 to M_2 (so $\hat{r} = \frac{\vec{r}}{r}$).

Often, this is written as...

 $\vec{F}_g = \frac{-GM_1M_2}{r^3}\vec{r}$. It is r^2 , but doing this and multiplying it to \vec{r} is to resolve the need to rid if the direction.

2 | Potential Energy

Whenever we talk about "energy", we are really talking about the CHANGE in energy.

Potential Energy Location:
