1 | Jacobian Determinant for Polar

We are to determine (pun not intended) the polar correction factor for a double integral, $dA = r dr d\theta$. To do this, we will have to first figure the change of bases expressions such that we can take:

$$f(x,y) = g(r,\theta) \tag{1}$$

Fortunately, this is already derived to use from before.

$$\begin{cases} x = r\cos\theta \\ y = r\sin\theta \end{cases} \tag{2}$$

Therefore, we have that:

$$f(x,y) = f(r\cos\theta, r\sin\theta) \tag{3}$$

And therefore, we can figure $J_{r,\theta}$:

$$J = \begin{bmatrix} \cos\theta & -r\sin\theta\\ \sin\theta & r\cos\theta \end{bmatrix} \tag{4}$$

Taking its determinant, then:

$$det(J) = r\cos^2\theta + r\sin^2\theta = r \tag{5}$$

And therefore, the change-of-basis result would be:

$$dx dy = r dr d\theta ag{6}$$
